

I'm not sure what it is, but the Enterprise should raise shields

Photos show a greatly simplified picture of overall cloud geometry. A research team at the Institute of Astronomy and Astrophysics, Academia Sinica (ASIAA) observed the luminous OB cluster-forming massive molecular clump with the Atacama Large Millimeter Array (ALMA), and revealed that the giant spiraling molecular gas arms are cradles of dense massive molecular cores. The research was published in the April 28 issue of the *Astrophysical Journal*.
